

## CYBER RISK AUDIT

### **How does the Audit work?**

Upon engagement, we determine the specific framework (ISO27001 or Essential8) to assess your business controls through. Working closely with your IT teams, CyberPathways will configure a monitoring tool to be placed on your business networks and monitor the flow of data through hardware, software and devices. This tool gathers data over a 3-4 week period. We encourage normal use of systems throughout this period in order to determine where any weaknesses in your current behaviours lie. We formulate the findings into a detailed report, which prioritises weaknesses based on your chosen framework and business risk tolerance. This provides a roadmap for ongoing training and system requirements into the future.

### **What is the benefit of doing a CyberRisk Audit?**

CyberPathways provides an independent, platform agnostic audit system, that helps you understand where sensitive data is stored, who has access to the data and how it is handled within your IT ecosystem, define acceptable practices and compliance processes and understand current habits and behaviours within your team. The review provides clear recommendations spanning your processes, your technology and your training needs which helps to prioritise Cyber Security future roadmaps and support investment decisions for your business.

## How does the Audit work?

CyberPathways will present a report detailing the results of the audit approximately one month after monitoring begins.

## Can we engage CyberPathways to continue data flow audit and monitoring on an ongoing basis?

CyberPathways uses the Guardware Assessor tool to complete the initial audit. Pending findings, this tool can be deployed on a permanent basis to monitor changes in behaviours and highlight data security issues. Coupled with CyberPathways alert monitoring software, this tool can act as your first line of monitoring defence on an ongoing basis.
